STUDIO GUIDE · v1.0

Working as a studio in the Trade Portal

Shared project & designer filters, focus-aware navigation, and best practices for multi-user design studios.

01

How filters flow across the portal

The Trade Portal uses two cross-page filters that bind your work to a single design context: a **Project** and a **Designer**. They are read from the URL on every page (`?project=...&designer=...`) so that any view you open — Quotes, Project Folders, Tearsheets, the Project Hub — shows only what is relevant to that context.

Where each filter lives

Project filter	Persisted in your browser <i>session</i> . Survives navigation between Quotes, Boards and Tearsheets so you don't have to re-pick it on every page. Cleared on sign-out or when you explicitly remove it.
Designer filter	URL-only, per-page. It scopes the current list to a single designer or atelier, but does not persist when you close the tab.
Active Filter Chips	A shared header strip appears on the Project Hub, Quotes and Boards whenever a filter is active. Each chip is removable; "Clear all" wipes both at once (with confirmation).

Why this matters for studios

Every team member who opens a deep link inherits the same filter context. Send a colleague `/trade/quotes?project=PROJ_ID&designer=Studio+Name` and they land on the exact slice you were looking at — no walkthrough required.

02

Keyboard & accessibility behaviour

The filter chips are designed to be fully operable without a mouse — important for senior specifiers reviewing long boards, and for assistive-tech users.

Tab	Moves focus into the filter chip group.
< / >	Moves focus between chip clear buttons and the "Clear all" action. Wraps at the ends.
Home / End	Jumps to the first / last clear control.
Enter / Space	Activates the focused control. "Clear all" prompts for confirmation.
Focus restoration	After clearing a single chip, focus moves to the remaining chip. After "Clear all" or the last remaining chip, focus returns to the filter region itself so screen readers announce the new state.
Live region	Each clear is announced politely — e.g. "Project Maison Riviera filter cleared" — without stealing focus.

03

Working as a multi-user studio

Most Maison Affluency accounts now serve studios with multiple specifiers, procurement leads and principals. The patterns below help your team operate with one source of truth.

A. One project, many seats

Create the project once from **Projects > New project**. The project ID becomes the anchor for every quote, board and tearsheet. Share the project URL with your team; the project filter will auto-restore on each colleague's session.

B. Hand-offs via deep links

Instead of pasting screenshots, copy the URL of the page you're on. The shared filter encoding means the recipient lands on the same Quotes view, Board, or Tearsheet — pre-filtered by project and (optionally) designer.

C. Designer scoping for procurement

When working through approvals brand-by-brand, layer the designer filter on top of the project filter. Clear just the designer chip when you move on to the next atelier; the project context stays intact.

D. Confirm before clearing both

"Clear all" requires confirmation in the multi-filter pages. This protects you from accidentally losing a curated project context mid-review — a common frustration on shared screens or during client calls.

Studio housekeeping tip

If a senior reviewer needs a clean slate, bookmark the unfiltered page (e.g. `/trade/quotes`) separately from the filtered deep link. Both can coexist in your team's shared bookmarks bar.

04

URL cheat sheet

`/trade/projects/<id>` Project Hub for that project, with chips active.

`/trade/quotes?project=<id>` Quote list scoped to the project.

`/trade/quotes?project=<id>&designer=<name>` Quotes for one designer inside one project.

`/trade/boards?project=<id>` Project folders for that project.

`/trade/tearsheets?project=<id>` Tearsheet builder pre-loaded with the project's picks.

Need help rolling this out across your team? Reach out to your Maison Affluency contact — we're happy to run a short walkthrough.
