The FF&E Schedule

Building, exporting and presenting Furniture, Fixtures & Equipment schedules from the Trade Portal.

01

What the FF&E Schedule is for

The FF&E Schedule (*/trade/ffe-schedule*) is your single source of truth for everything specified on a project — every chair, sconce, rug, joinery item — with quantities, lead times, trade pricing and status. It pulls automatically from your project's quotes, boards and tearsheets so you never re-key data.

Three things it replaces

Spreadsheets

No more parallel Excel files drifting out of sync with the portal. The schedule is the live view of what is actually quoted and approved.

Status emails

Each line carries a status (Specified, Quoted, Approved, Ordered, Delivered) so principals can scan progress without a stand-up.

Manual totals

Subtotals by room, by designer and by project roll up automatically, in the project currency.

Why the auto-population matters

The schedule reads from the same project context as your Quotes and Boards. Add a piece to a board with the project filter active and it appears on the schedule on next load — no duplicate entry, no reconciliation.

02

Filling out a schedule line

Each line begins as a draft auto-created from a quote or board item. From there, your team enriches it with project-specific information.

Room / Area

Free text, with auto-suggest from rooms used elsewhere in the project. Drives the room subtotals.

Quantity

Defaults to 1; change per-line. Rolls into trade-price totals.

Finish / Variant	Captures the finish, fabric or size variant chosen — important when the parent product has multiple SKUs.
Lead time	Inherited from the product where known; editable per project.
Status	Specified › Quoted › Approved › Ordered › Delivered. Drives the colour-coded status pill.
Notes	Internal notes for procurement (e.g. "client to confirm leg finish before 12 May").

03

Exporting and sharing the schedule

PDF export

The PDF export carries the project header, room subtotals and a status legend. It is suitable for client reviews and for issuing to procurement partners. Pricing columns can be hidden for client-facing exports.

CSV export

The CSV export contains every column, including SKUs and unit pricing — built for import into your studio's project management or accounting system.

Live deep link

For internal stakeholders, share the URL: `/trade/ffe-schedule?project=<id>`. They will see the live schedule with the same project filter applied, including any updates since the last export.

Versioning & sign-off

When a client signs off on a schedule, generate a dated PDF export and store it in the project folder. The portal continues to evolve; the PDF is your point-in-time record.

04

Best practice for studios

A. One schedule per project

Avoid splitting a single project across multiple schedules. If a residence has several wings, use the Room field to segment instead — the room subtotals do the rest.

B. Keep status honest

The colour-coded status is what principals scan. Move items to **Approved** only when they truly are; downstream order timeline forecasts depend on it.

C. Use notes for client-facing language

Procurement notes are internal. For anything the client should see on the export, add it to the line description — exports respect description but hide internal notes.
