STUDIO GUIDE · v1.0

Building a Tearsheet

Assembling client-ready, one-page specification tearsheets from curator picks and trade products.

01

What a tearsheet is

A tearsheet is a one-page, client-ready specification document for a single piece — a chair, lamp, console — that combines the hero image, materials, dimensions, lead time and your studio's framing of why it belongs in the project. The Tearsheet Builder (</trade/tearsheets>) generates these in seconds from any product in the portal.

When to issue one

Client review	Before a board meeting, when you want one piece to stand on its own.
Procurement	When sending a single item to a sub-contractor or installer who doesn't need the full schedule.
Substitution	When proposing an alternative to a previously approved piece, side-by-side with the original.

Tearsheet vs. spec sheet

A **spec sheet** is the manufacturer's technical document (dimensions, certifications, finish codes). A **tearsheet** is your studio's curated framing of that piece for the client. Both have a place; they are not interchangeable.

02

Building one in the portal

Open any product, curator pick or board item and click **Generate tearsheet**. The builder pre-fills hero image, title, materials, dimensions, lead time and trade price from the source record.

Hero image	Defaults to the primary product image. Swap to a lifestyle shot from the gallery if the room context is more useful for the client.
-------------------	---

Project framing	A short paragraph in your studio's voice — why this piece, in this room, for this client. This is the only field you must write yourself.
Materials & dimensions	Inherited from the product record; editable per tearsheet (e.g. when you've specified a custom finish).
Lead time	Inherited from the product, then per-project override if the brand has quoted a different schedule.
Pricing	Trade price is shown by default. Hide pricing for client-facing exports if your fee model is fixed.

03

Layout and branding

Studio header

Each tearsheet PDF carries the Maison Affluency wordmark in the footer and your project header at the top. The body of the page is yours: hero image left, copy right, dimensioning beneath.

Cover style options

Choose between the editorial (jade header) and minimal (cream) cover styles when bundling multiple tearsheets into a presentation deck. The editorial style aligns with the rest of the portal's print collateral.

When to white-label

Tearsheets respect the white-label policy: brand-specific manufacturer branding is suppressed in favour of the piece, materials and your studio's framing. The client sees the work, not the supply chain.

04

Bundling tearsheets into a deck

From the Presentation Builder (*/trade/presentations*), drop multiple tearsheets into a single deck — by room, by designer, or as a substitution comparison.

Recommended sequence

1. Cover	Project name, client name, date, and a single hero image.
2. Concept	One short paragraph framing the room or scheme.
3. Tearsheets	Grouped by room. Within a room, lead with the anchor piece (sofa, dining table) before accents.
4. Schedule summary	A single page summarising room subtotals from the FF&E Schedule.
5. Next steps	Approvals required, lead-time-critical items, target dates.

05

Studio patterns we recommend

A. Write the framing once, reuse it

If a piece appears on multiple tearsheets across projects, save the framing paragraph as a snippet. Edit per-project rather than re-writing from scratch.

B. Lead with the image

Clients respond to the photography first. Choose the hero shot that best reads at A4 size — busy lifestyle shots can compete with the spec content.

C. Keep dimensions metric and imperial

For international clients, the builder shows both. Don't strip imperial unless you've confirmed your client doesn't need it.

One last check

Before issuing, preview the PDF at 100%. Tearsheets read very differently in the browser thumbnail vs. on a printed A4 page in a client's hands.
